

Multistandard AM FM Sound IF IC

TDA 2460-2

Preliminary Data

Bipolar IC

Controlled AM IF amplifier including a quasi-synchronous demodulator and integral mean value control for French sound IF, limiter amplifier with FM demodulator, AF part with SCART input and output, volume control and AF output.

Features

- Switch-over mode to CCIR standard for B/G and L systems
- Integral control for AF sound
- Standardized SCART interface
- High AM and FM sensitivity
- Low distortion factor

Type	Ordering Code	Package
TDA 2460-2	Q67000-A8200	P-DIP-20

Circuit Description

The component contains a four-stage, capacitatively coupled control amplifier, a quasi-synchronous demodulator, an integral mean value control voltage generator and an AF pre-amplifier according to the French sound IF standard. The FM section contains an eight-stage symmetrical limiter amplifier with a coincidence modulator and an AF pre-amplifier with connection for the deemphasis capacitor. The two AF sources are routed to the volume control via an analog switch of the SCART socket and a record/playback switch.

Application Circuit

Simplified External Circuitry for the TDA 2460 Demodulator Circuit

The TDA 2460 AM (double side-band) demodulator circuit allows simplified external circuitry.

The new sound demodulator circuit, developed for application in television L standard and multistandard sets, provides the user with the following advantages:

Cost savings by not requiring the carrier select circuit (L , C) and the necessary tuning (time).

The circuit that is part of the carrier generation circuit becomes unnecessary because of the excellent capture ratio features of the limiter.

Capture ratio defines the ability of a limiter amplifier to distinguish a useable signal from an interference signal with a lower amplitude.

In this specific section, the modulation side-bands represent the interference signal and the carrier the useable signal (desired switching carrier).

Even with a 100% modulation (France 80%) the distance from the side-bands to the carrier is 6 dB.

The system guarantees secure function. This is also shown by measurements with respect to:
 harmonic distortion
 noise
 signal/noise ratio

in a comparison with/without regenerative circuit. Only the control threshold shifts by 2 dB.
