

Description

The μ PD8748H and μ PD8749H are part of the μ PD8048 family of single-chip 8-bit microcomputers. They are high-speed NMOS processors that function efficiently in control and arithmetic applications. The flexible instruction set allows you to directly set and reset individual data bits within the accumulator and the I/O ports. The variety of branch and table look-up instructions simplifies the implementation of standard logic functions.

The instruction set is made up of one- and two-byte instructions. Over 70% are single-byte instructions. Instruction execution requires only one or two cycles. Over 50% require a single cycle.

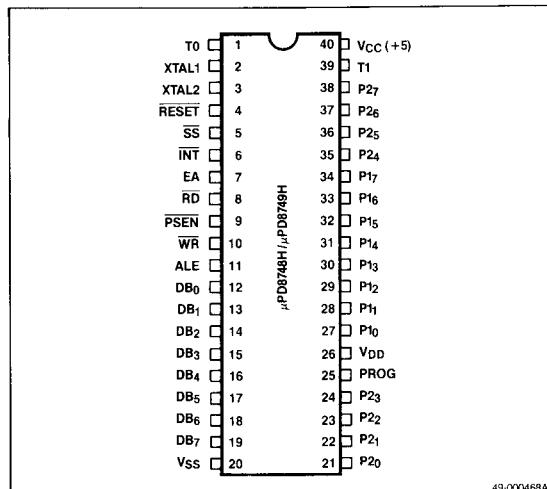

The μ PD8748H/49H function as stand-alone microcomputers. You can expand their function with standard 8080A/8085A peripherals and memories. They each contain 1024 \times 8 bits (μ PD8748H), or 2048 \times 8 bits (μ PD8749H) of ROM program memory, 64 \times 8 bits (μ PD8748H), or 128 \times 8 bits (μ PD8749H) of RAM data memory, 27 I/O lines, an 8-bit internal timer/event counter, oscillator, and clock circuitry.

The μ PD8748H/49H differs from the μ PD8048/49 in that they have 1K (μ PD8748H) or 2K (μ PD8749H) of on-board EPROM. This is useful in preproduction or prototype applications where the software is not complete or in system designs in quantities that do not require a mask ROM. See the μ PD8048H/8035HL or μ PD8049H/8039HL data sheets for more information.

Features

- Low programming voltage (21V)
- μ PD8748H is fully compatible with 8048/8748/8035
- μ PD8749H is fully compatible with 8049/8749/8039
- NMOS silicon gate technology
- Single +5V supply
- 1.36 μ s instruction execution time
- 96 instructions; 70% single byte
- Internal timer/event counter
- 1024 \times 8 EPROM program memory (μ PD8748H only)
- 2048 \times 8 EPROM program memory (μ PD8749H only)
- 64 \times 8 byte RAM data memory
- Single interrupt level
- 27 I/O lines
- Internal clock generator
- 8-level stack
- Compatible with 8080A/8085A peripherals
- Available in one-time-programmable plastic package

Pin Configuration

49-000468A

Ordering Information

Part Number	Package Type	Max Frequency of Operation
μ PD8748HC	40-Pin plastic DIP	11 MHz
μ PD8748HD	40-Pin cerdip with quartz window	11 MHz
μ PD8749HC	40-Pin plastic DIP	11 MHz
μ PD8749HD	40-Pin cerdip with quartz window	11 MHz

Pin Identification

No.	Symbol	Function
1, 39	T ₀ , T ₁	Testable inputs 0 and 1
2, 3	XTAL1, XTAL2	Crystal inputs
4	RESET	System reset input
5	SS	Single step input
6	INT	Interrupt input
7	EA	External access input
8	RD	Read strobe output
9	PSEN	Program store enable output
10	WR	Write strobe output
11	ALE	Address latch enable output
12-19	D ₀ -D ₇	8-bit bidirectional port
20	V _{SS}	Ground
21-24, 35-38	P ₂₀ -P ₂₇	8-bit quasibidirectional port 2
25	PROG	Program pulse input during EPROM programming output when interfacing to 8243
26	V _{DD}	Programming power supply
27-34	P ₁₀ -P ₁₇	8-bit quasibidirectional port 1
40	V _{CC}	Primary power supply

μ PD8748H/49H**Pin Functions****T0, T1 (Testable inputs 0 and 1)**

T0 uses the conditional transfer functions JT0 and JNT0; T1 uses JT1 and JNT1 to branch on condition of the external pin level. The ENT0 CLK instruction allows T0 to output, the internal state clock (CLK). Use the STRT CNT instruction to use T1 as the timer/counter input source.

XTAL1, XTAL2 (Crystal inputs)

XTAL1 and XTAL2 are two sides of the crystal input for an external oscillator or frequency (non-TTL compatible V_{IH}).

RESET (Reset)

Active low input for processor initialization. RESET is also used for PROM programming verification and power down (non-TTL compatible V_{IH}).

SS (Single step)

Active low single step input. SS and ALE allow the processor to single step through each instruction in program memory.

INT (Interrupt)

Active low interrupt input. INT starts an interrupt if an enable interrupt instruction has been executed. RESET disables the interrupt. You can test INT with a conditional jump instruction.

EA (External access)

A logic 1 at the EA input tells the processor to perform all program memory fetches from external memory.

RD (Read strobe)

Active low read strobe output. RD pulses low when the processor performs a bus read. RD also enables data onto the processor bus from a peripheral device and functions as a read strobe for external data memory.

PSEN (Program store enable)

Active low program store enable output. PSEN becomes active only during external memory fetches.

WR (Write strobe)

Active low write strobe output. WR pulses low when the processor performs a bus write. WR also functions as a write strobe for external data memory.

ALE (Address latch enable)

Once each cycle, the falling edge of ALE latches the address for external memory or peripherals. You can also use ALE as a clock output.

D₀-D₇ (8-bit bidirectional bus)

The RD and WR strobes allow you to perform synchronous reads and writes on this port. The contents of D₀-D₇ can be latched in static mode. During an external memory fetch, D₀-D₇ holds the LSBs of the program counter. PSEN controls the incoming addressed instruction. D₀-D₇ also holds address and data information for external RAM data store instruction (controlled by ALE, RD, and WR).

V_{ss} (Ground)

Ground.

P₂₀-P₂₇ (Port 2)

Port 2 is one of two 8-bit quasibidirectional ports. P₂₀-P₂₃ hold the four MSBs of the program counter for external data memory fetches; P₂₄-P₂₇ hold data. P₂₀-P₂₃ are also used as a 4-bit I/O bus for the μ PD8243 I/O expander.

PROG (Program pulse)

Apply a +18V pulse to the PROG input to program the μ PD8748H. You can also use PROG as an output strobe for the μ PD8243.

V_{DD} (Programming power supply)

V_{DD} must be +21V to program the μ PD8748H or +5V for the ROM and PROM versions for normal operation.

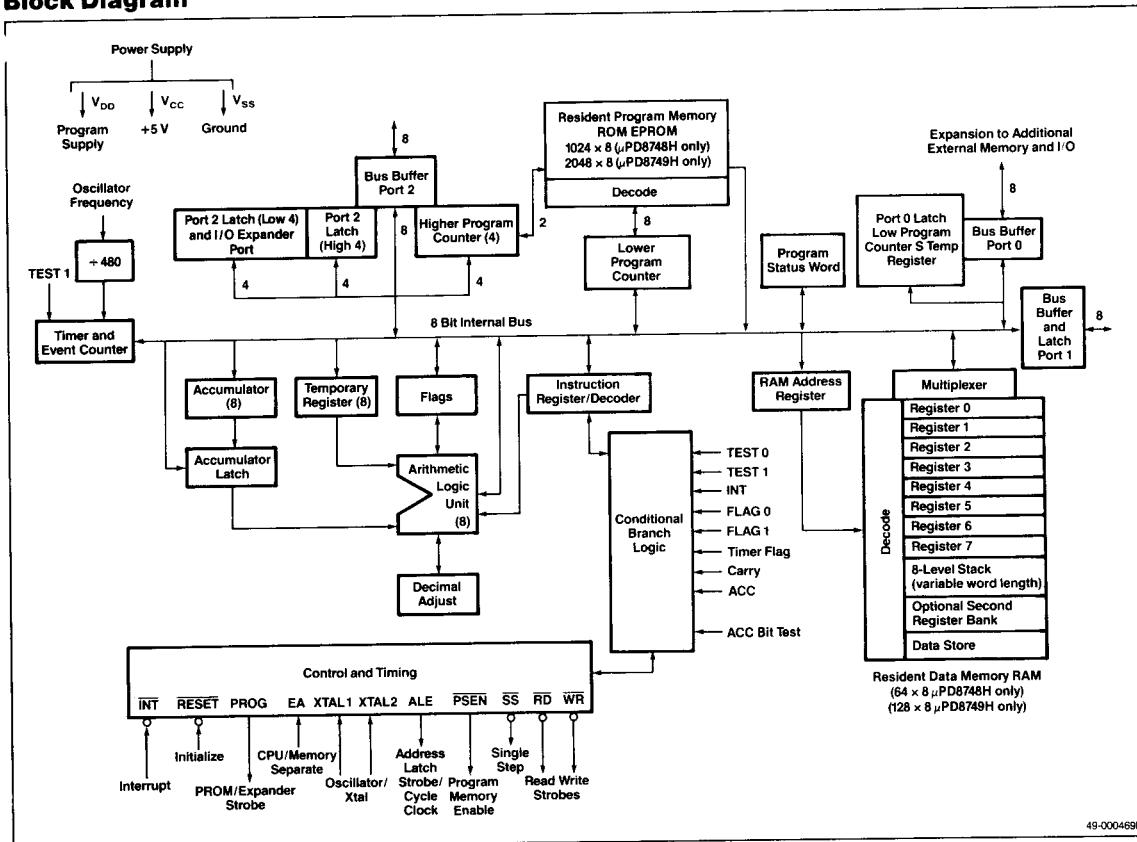

P₁₀-P₁₇ (Port 1)

Port 1 is one of two 8-bit quasibidirectional ports used for external data memory fetches.

V_{CC} (Power supply)

V_{CC} must be +5V to program and operate the μ PD8748H.

Block Diagram

Absolute Maximum Ratings

$T_A = 25^\circ\text{C}$

Operating temperature, T_{OP}	0°C to +70°C
Storage temperature, T_{ST}	-65°C to +150°C
Output voltage, V_O	-0.5 V to +7.0 V
Input voltage, V_I	-0.5 V to +7.0 V
Power supply voltages, V_{CC}, V_{DD}	-0.5 V to +7.0 V

Comment: Exposing the device to stresses above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational sections of the specification. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

DC Characteristics

$T_A = 0^\circ\text{C} \text{ to } +70^\circ\text{C}$, $V_{CC} = V_{DD} = +5\text{V} \pm 10\%$, $V_{SS} = 0\text{V}$

Parameter	Symbol	Limits			Test Conditions
		Min	Typ	Max	
Input low voltage (except XTAL1, XTAL2, RESET)	V_{IL}	-0.5		0.8	V
Input low voltage (XTAL1, XTAL2, RESET)	V_{IL1}	-0.5		0.6	V
Input high voltage (except XTAL1, XTAL2, RESET)	V_{IH}	2.0		V_{CC}	V
Input high voltage (XTAL1, XTAL2, RESET)	V_{IH1}	3.8		V_{CC}	V
Output low voltage (Bus)	V_{OL}			0.45	V $I_{OL} = 2.0\text{ mA}$
Output low voltage (RD, WR, PSEN, ALE)	V_{OL1}			0.45	V $I_{OL} = 1.8\text{ mA}$

DC Characteristics (cont) $T_A = 0^\circ\text{C}$ to $+70^\circ\text{C}$, $V_{CC} = V_{DD} = +5\text{ V} \pm 10\%$, $V_{SS} = 0\text{ V}$

Parameter	Symbol	Limits			Test Conditions
		Min	Typ	Max	
Output low voltage (PROG)	V_{OL2}		0.45	V	$I_{OL} = 1.0\text{ mA}$
Output low voltage (all other outputs)	V_{OL3}		0.45	V	$I_{OL} = 1.6\text{ mA}$
Output high voltage (Bus)	V_{OH}	2.4		V	$I_{OH} = -400\text{ }\mu\text{A}$
Output high voltage (RD, WR, PSEN, ALE)	V_{OH1}	2.4		V	$I_{OH} = -100\text{ }\mu\text{A}$
Output high voltage (all other outputs)	V_{OH2}	2.4		V	$I_{OH} = -40\text{ }\mu\text{A}$
Input leakage current (T_1 , INT)	I_{LI}		± 10	μA	$V_{SS} \leq V_I \leq V_{CC}$
Input leakage current ($P1_0$ - $P1_7$, $P2_0$ - $P2_7$, EA, SS)	I_{LH}		-500	μA	$V_{SS} + 0.45\text{ V} \leq V_I \leq V_{CC}$
Output leakage current (Bus, T0, high impedance)	I_{LO}		± 10	μA	$V_{SS} + 0.45\text{ V} \leq V_I \leq V_{CC}$
Supply current (V_{DD})	I_{DD}	2	5	mA	
Total supply current	$I_{DD} + I_{CC}$	85	110	mA	

Programming DC Characteristics $T_A = 25^\circ\text{C} \pm 5^\circ\text{C}$, $V_{CC} = +5\text{ V} \pm 5\%$, $V_{DD} = +21\text{ V} \pm 0.5\text{ V}$

Parameter	Symbol	Limits			Test Conditions
		Min	Typ	Max	
V_{DD} voltage high level	V_{DDH}	20.5		21.5	V
V_{DD} voltage low level	V_{DDL}	4.75		5.25	V
PROG voltage high level	V_{PH}	17.5		18.5	V
PROG voltage low level	V_{PL}	4.0		V_{CC}	V
EA program / verify voltage high level	V_{EAH}	17.5		18.5	V
V_{DD} high voltage supply current	I_{DD}		20.0	mA	
PROG high voltage supply current	I_{PROG}		1.0	mA	
EA high voltage supply current	I_{EA}		1.0	mA	

AC Characteristics $T_A = 0^\circ\text{C}$ to $+70^\circ\text{C}$, $V_{CC} = V_{DD} = +5\text{ V} \pm 10\%$, $V_{SS} = 0\text{ V}$

Parameter	Symbol	Limits			Test Conditions
		Min	Typ	Max	
<i>Read, Write, and Instruction Fetch — External Data and Program Memory</i>					
ALE pulse width	t_{ILL}	150			ns (1, 3)
Address setup before ALE	t_{AL}	70			ns (1, 3)
Address hold after ALE	t_{LA}	50			ns (1, 3)
Control pulse width (RD, WR)	t_{CC1}	480			ns (1, 3)
Control pulse width (PSEN)	t_{CC2}	350			ns (1, 3)
Data setup before WR	t_{DW}	390			ns (1, 3)
Data hold after WR	t_{WD}	40			ns (1, 2, 3)
Cycle time	t_{CY}	1.36		15.0	μs
Data hold after RD, PSEN	t_{DR}	0		110	ns (1, 3)
RD to data in	t_{RD1}		330	ns	(1, 3)
PSEN to data in	t_{RD2}		190	ns	(1, 3)
Address setup before WR	t_{AW}	300			ns (1, 3)
Address setup before data in (RD)	t_{AD1}		730	ns	(1, 3)
Address setup before data in (PSEN)	t_{AD2}		460	ns	(1, 3)

STOP TCNT		Stop count for event counter.	0	1	1	0	0	1	0	1	1	1		
STRT CNT		Start count for event counter.	0	1	0	0	0	1	0	1	1	1		
STRT T		Start count for timer.	0	1	0	1	0	1	0	1	1	1		
Miscellaneous														
NOP		No operation performed.	0	0	0	0	0	0	0	1	1			

Note:

- (1) Instruction code designations r and b form the binary representation of the registers and ports involved.
- (2) The dot under the appropriate flag bit indicates that its content is subject to change by the instruction it appears in.
- (3) References to the address and data are specified in bytes 2 and/or 1 of the instruction.
- (4) Numerical subscripts appearing in the function column reference the specific bits affected.

Instruction Set Symbol Definitions

Symbol	Description
A	Accumulator
AC	Auxiliary carry flag
addr	Program memory address (12 bits)
B _b	Bit designator ($b=0-7$)
BS	Bank switch
BUS	Bus port
C	Carry flag
CLK	Clock signal
CNT	Event counter
D	Nibble designator (4 bits)
data	Number or expression (8 bits)
DBF	Memory bank flip-flop
F0, F1	Flags 0, 1
I	Interrupt
P	"In-page" operation designator

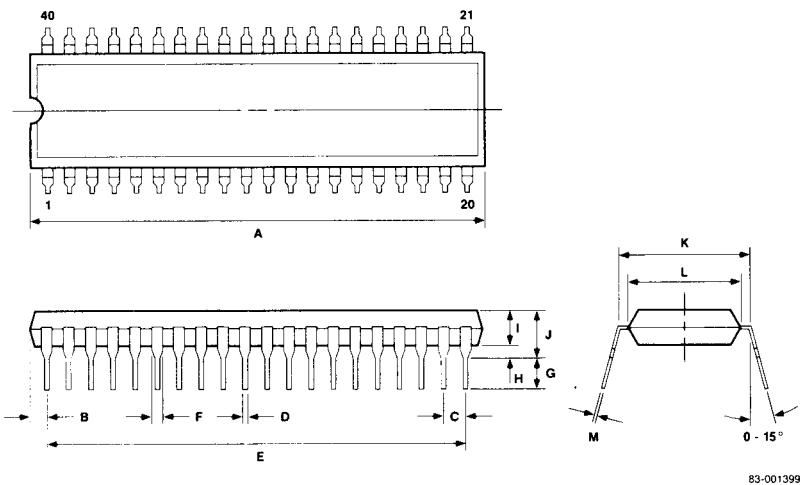

Symbol	Description
Pp	Port designator ($p=1, 2$ or $4-7$)
PSW	Program status word
Rr	Register designator ($r=0, 1$ or $0-7$)
SP	Stack pointer
T	Timer
TF	Timer flag
T0, T1	Testable flags 0, 1
X	External RAM
#	Prefix for immediate data
@	Prefix for indirect address
\$	Program counter's current value
(x)	Contents of external RAM location
((x))	Contents of memory location addressed by the contents of external RAM location
←	Replaced by

Packaging Information**40-Pin Plastic DIP (600 mil)**

Item	Millimeters	Inches
